Mountain Weather Forecast

Ground Conditions Supplement
Date Saturday 8 January. Location Catstye Cam summit at 1345. Temperature plus 0.6 degC. Maximum wind speed 29.6mph.Wind chill minus 7.8degC. Average wind speed 22.5mph
Full report:
A mild and wet start to the day with improving and cooler conditions arriving in the afternoon. The snow line starts at roughly 350-400m although this lifted through the day.
Snow distribution is quite varied with north and east-facing slopes generally holding the greatest accumulations of snow, and west through south-facing slopes hold the least.
Patches of ice are also present underneath the snow in some areas, particularly around drainage lines at mid-elevation. Snow depth varies significantly from almost nothing over high exposed ground to knee-deep drifts in other places. Small cornices are also present around corrie rims and should be given a wide berth.
All of the snow encountered today was soft and wet, however, with the freezing level forecast to drop to around 600m overnight, more ice will be present and the snow is likely to be very hard and icy. In these conditions, a slip or fall even on moderately steep ground could have very serious consequences. Striding and Swirral edge are in winter condition and should only be attempted by those with suitable experience and the correct equipment. For anyone venturing above the snowline tomorrow, microspikes and walking poles are advisable and if you are planning routes over or above steep ground, an ice axe and crampons are essential. Warm and waterproof clothing including hats/ gloves, headtorch, map, and compass are also essential.This is an automated email. If you need a response please email felltop.assessors@lakedistrict.gov.uk
